Just Go!

Extra assignment I

A new airline called **LetsGo** has emerged and they are ready to compete! In order to compete with all the other airlines it needs a responsive website that works on all screen sizes. After having analyzed the traffic to the older website they have discovered that using **CSS Grid Layout** is a safe bet. Your job is to create this website. In order to work on this assignment you must use the **template.zip** file provided in Canvas. In the root of the **template** folder, there are three images showing how the layout should look like in all screen sizes, there is also a filed called **README.md** which describes how the template works.

Description

All layouts should be created using **CSS Grid Layout**.

- **(33.3%)** Desktop layout
- **(33.3%)** Tablet layout
- **(33.3%)** Mobile layout

Other

For the tablet and mobile view, there should be no horizontal scrolling (**only vertical**). In order to do that the content must be properly sized to fit the screen size. Sometimes that can be done by making the font smaller, but it must be visible though. All color codes reside in **variables.less** located in the **less/** folder in the template.

SIZES

- Right aside menu is **250px** wide
- Logo is **200px** wide
- Links in secondary nav are **1.5em** in font size
- The border width for the footer, primary nav and right aside is **8px** wide
- The city caption is **2em** in font size
- The city images are **250x150** (px)
- The usual padding used is **40px**
- The circle city images are **150x150** (px)
- The pilot images is **150px** wide

Sizes described above are for the desktop screen size, these sizes may vary when moving from one screen size to another.

Submission

The template folder (*with all the changes*) should be submitted as a compressed file (***.zip, *.rar**).
